Session 2 Handout: Prompt Chains and Iterative Refinement

Advanced Prompting & API Integration · MSc AI and Digital Strategy Management

1. Chain design canvas

My business task:

Rule: one step, one job, one input, one output format.

Step	Job of this step	Input	Output format
1			
2			
3			
4			

2. Few-shot template

Use this structure wherever a step's output varies from run to run.

```
Task: [what the model must do]
Format: [exact output format]

Example 1
Input: [...]
Output: [...]

Example 2
Input: [...]
Output: [...]

Now do the same for:
Input: [new input]
Output:
```

Tips: cover edge cases, keep the format identical, use 2 to 5 examples, vary them on purpose to avoid copying their biases.

3. Quality criteria

Define these before you test.

Criterion	My check	Pass mark (1–5)
Accuracy		
Format		

Criterion	My check	Pass mark (1–5)
Tone		
Consistency		
(Your own)		

4. Test log

Change one thing at a time, then log it.

Run	Chain version	Test input	Output summary	Score by criterion	Change made next
1	v1				
2	v1				
3	v1				
4	v2				
5	v2				

5. Peer challenge (Workshop 2)

Swap chains with your partner and try to break theirs with:

- an unusually short input
- an unusually long or messy input
- an input in a different tone or language
- an input with missing information

What broke?

What fix would you suggest?

6. Deliverable checklist

Submit before lunch (end of Session 2): a draft prompt chain with documented test results.

- Chain steps with prompts and output formats
- At least 3 varied test inputs
- Quality criteria
- Completed test log with at least two versions
- One paragraph: what failed most and how you fixed it

How to submit

- Email one PDF or Word file named `Surname_Session2_Chain` to fabien.gueret-jullien@bsb-education.com

- Subject line: `[Session 2] Surname – Chain draft`
- Do not include personal or confidential data in your test inputs
- No reply means your email arrived

7. Over lunch, before Session 3

- Check that you can log in to your AI tool and account (10 minutes).
- Optional: look at a public API's documentation page and note one thing you do not understand.
